EDUCATION

University of California San Diego, Jacobs School of Engineering **San Diego, USA**
M.S. in Electrical and Computer Engineering (GPA: 3.5/4.0) Sep 2021 – Jun 2023
- Coursework: Software Foundations, Operating Systems, Computer Networks, Front-end Development, Graduate Networked System, Advanced Data Structure, Distributed Systems

National Taipei University **New Taipei City, Taiwan**
B.S. in Communication Engineering (GPA: 3.46/4.0) Sep 2015 – Jun 2019
- Coursework: Data Structure, Advanced Computer Programming, Database System

SKILLS

Programming: C/C++, Golang, Java, Python, Kotlin, JavaScript, HTML/CSS, MATLAB
Tools: Git, Visual Studio, Visual Studio Code, Zookeeper, Kafka, MongoDB

PERSONAL PROJECTS (code available upon request)

MySQL-like Relational Database System in C++17 Apr 2022 – June 2022
- Designed and constructed a robust relational database akin to MySQL using C++17, showcasing flawless performance with seamless handling of **15000+** data entries.
- This system entailed **interpreting**, **manipulating**, **querying**, and **presenting table data results**.
- Developed the database system based on the **MVC (Model-View-Controller)** application design pattern.
- Employed **scanning**, **tokenizing**, and **parsing** techniques proficiently to manage user input.
- Implemented the **chain-of-responsibility** design pattern to efficiently process user-provided commands.
- Employed the **factory** design pattern to seamlessly handle statements.
- Optimized database performance with **indexes** and **LRU** Cache, achieving approximately a **20%** improvement.

Distribute Systems Development (Java, Kafka, Zookeeper, MongoDB, Google Cloud Platform) June 2023 – July 2023
- Established and deployed a distributed system with **Java** on **Google Cloud Platform**, achieving **scalability** and **fault tolerance**.
- Utilized **Kafka** as message brokers with **Zookeeper** for **scalability** and enhanced the **fault tolerance** by leader algorithm.
- Optimized network communication by leveraging **HTTP** and handling data serialization and deserialization with **protocol buffer**.
- Enhanced system performance and reliability by incorporating **load balancers** to avoid bottlenecks and ensure higher **availability**.
- Launched **MongoDB** with **replication set (master/slave architecture)** for high availability and data **sharding** for scalability.

Fault-tolerance Scalable Cloud-Based File Storage service in Golang Feb 2023 – Mar 2023
- Developed a **Dropbox-like**, **scalable**, **networked** file storage application, facilitating **concurrent** connections from multiple clients to access a shared set of files on the server. Utilized **gRPC** for client interaction and managed **100+** files.
- Divided files on the server into an ordered sequence of one or more blocks. Employed the **SHA-256 hash function** for each block, creating a hash list that represented the file.
- Utilized **protocol buffers** for **gRPC** and incorporated **versioning** and hash list techniques to handle update conflicts.
- Created and maintained an **index.db** file in the base directory of the client program to streamline **synchronization** operations.
- Implemented a mapping approach based on **consistent hashing** for efficient block storage and to ensure server **scalability**.
- Enhanced server reliability by integrating **fault tolerance** mechanisms based on the **RAFT distributed consensus protocol**.

Simple Router in C Feb 2023 – Mar 2023
- Constructed a streamlined router capable of receiving raw Ethernet frames and efficiently handling various packet types, including **ARP requests**, **ARP replies**, **ARP caching**, **ICMP** (returning messages to the sending host), **switching**, **longest prefix matching**, **IP sanity-check** (ensuring minimum length and checksum), and other vital IP forwarding functionalities.
- Implemented **ping** and **traceroute** operations, and enabled file downloads using HTTP from designated application servers.
- Implemented **Trie-based Longest Prefix Match**, achieving **90%** improvement over brute force method for **1000+** IPv4 addresses.

Nachos Operating System Implementation in Java Sep 2022 – Nov 2022
- Executed the development of the **Alarm class**, implementing **waitUntil**, **timerInterrupt**, and **cancel**, as well as **KThread.join**.
- Employed **interrupt disable and restore techniques** to ensure atomicity while implementing **condition variables**. Incorporated **sleep**, **wake**, **wakeAll**, and **sleepFor** methods.
- Orchestrated the creation of the **Rendezvous** class, utilizing **locks** and **condition variables** to establish a robust mechanism for thread **synchronization** and value exchange.
- Implemented essential file system calls, including create, open, read, write, close, unlink, exec, join, exit, and halt.
- Managed the allocation of physical memory pages to facilitate **multiprogramming**, ensuring optimal utilization and preventing memory overlap among different processes.
- Implemented advanced memory management techniques such as **Demand Paging, Lazy Loading**, and **Page Pinning**.
